

Homework Problems

1. Simplify the expression: $(2x^2 + 3x - 4 + x^2 - 5x + 7)$.
2. Solve for (x): $(3x - 7 = 2x + 8)$.
3. Find the value of (x) that satisfies the equation $(x^2 - 5x + 6 = 0)$.
4. If $(y = 4x + 3)$, find the value of (y) when $(x = -2)$.
5. Factor the quadratic expression: $(x^2 - 9x + 20)$.

Answers

Answer: $3x^2 - 2x + 3$

Answer: $x = 15$

Answer: $x = 2$ or $x = 3$

Answer: $y = -5$

Answer: $(x - 4)(x - 5)$
